# Catavolt React Component Overview

The Catavolt React SDK

- Provides a set of React components that allow access to the Catavolt UI Model

- Built on top of the "pure Javascript" Catavolt SDK, which allows low-level access to Catavolt data

- Each component provides default behavior and optionally, access to specific parts of the SDK

- 2 Levels of components, "Core" and "Extended"

- Core components provide minimal style (if any)

- Extended components provide a basic UI, styled with css and bootstrap, which is easily customized

- Components allow for 'delegate' render functions giving complete control of what's rendered

Catavolt React Component Stack
